Market research template south africa

Peter Beavis/Stone/Getty Images South Africa became independent from Britain on 11 December 1931, but the British monarch remained head of state. On 31 May 1961, the country became a republic, breaking all formal ties with Britain. After 1961, South Africa was independent of the European powers that colonized it, but the colonizers, in the form of the white elites who dominated politics and the economy in the new country, were still in charge. The country's black majority did not participate in the 1961 referendum, and they had few rights under South Africa's racist apartheid regime. True independence for most of the country only came in 1994, when Nelson Mandela and the African National Congress came to power after a multiracial, multiparty election. Arts & Crafts in GraskopDelagoaThis bustling shop has contemporary crafts ranging from the work of beads and woven baskets to engraved ostrich eggs and makeup bags decorated with African proverbs. It's solidly South African in the main, but there are pieces of... Jewelry Galleries at BarbertonPilgrim & Crown GalleryIn the century-old construction of iron and steel works, Pilgrim & Crown sells a range of handicrafts, including Umjindi's impressive silver jewelry. Crafts in SabieMphozeni CraftsA lovely selection of African handicrafts and textiles, including jewelry, slatians, wood carvings, ceramics, baskets and children's t-shirts. If you are buying a new TV, then look no further. TechRadar has brought together the biggest, brightest and smartest televisions that have ever passed through our eyes. High-performance TVs can be expensive, but you need to think of it as an investment that will return value over many hours and many years, and will benefit your entire family. Most of the 2020 TV tracks haven't arrived yet, so many of the sets below are from 2019, but don't let that keep you away. Updates between generations of TV tend to be small steps, so you won't lose a lot when staying with these models. Remember, all these TVs receive software updates over the Internet anyway. For now, you can safely opt to upgrade to one of these best performing TVs currently on the market. Is bigger is better? Check out our picks of the best 65-inch TVsNá-ivsBest at a glance:Samsung Q90R QLED TVLG CX OLED SeriesBest 8K: Samsung Q950TS QLED TVBudget OLED: LG B9 OLED SeriesSamsung QLED TVBest TVEest TVLast year, the Samsung Q9FN was the TV to be beat. It won the galore plaudits for its features and quality image, not to mention its excellent and improved smart platform that came with support for Samsung's Bixby and SmartThings. However, it was not perfect and there were legitimate complaints about viewing angles and a one local dimming system that crushed details just above black. Samsung clearly took these criticisms seriously, and addressed them directly in the Q90. The new model has a noticeably superior viewing angle that holds itself against an OLED TV, and the local dimming delivers deep blacks without losing shadow details. For this, the new Ultra Black Elite filter is nothing short of a revelation, rejecting ambient light in a way that just staggers belief. The Q90 is able to deliver images that can compete directly with an OLED, with natural colors, bright highlights, deep blacks and well-defined shadows. It can also outperform any OLED when it comes to HDR, with images that are often breathtaking in its details and dynamic range. In fact, our only real criticism would be that, unlike some of the competition, the Q90 doesn't support Dolby Vision. However, in all other respects, the Samsung Q90 is an absolutely stellar new Samsung TV that takes QLED to another level. Read the full review: Samsung Q90R QLED TV (Image Credit: LG)The LG CX OLED is certainly the best OLED TV for 2020, and deserves to totally scrape the top of this list for the best TVs available today. Itered in last year's LG C9 Series, the LG CX may not look so different – and it's not. But by continuing the same mesmerizing image quality and the standout webOS smart platform, with some modern updates like HDMI 2.1 and an A9 Gen 3 processor, it has managed to outperform its predecessor. With a new 48-inch OLED TV size now available too, the CX is an even more flexible proposition for a wider variety of wallets and homes. With a slim design and support for Dolby Vision and Atmos – along with the built-in audio screaming – it's a fantastic choice in any size. LG is really looking to attract players with its 2020 range, too, with input lag at rock bottom, support for Nvidia G-Sync and compatibility with 4K/120Hz gameplay for next-generation consoles. You won't get HDR10+ here, unfortunately, and UK viewers will have to go without all their fave catch-up apps, but make no mistake – this is the best OLED TV for you in 2020.Read the full review: LG CX OLED (Image Credit: Samsung)85 inch: Samsung QN85Q950TS | 75 inch: Samsung QN75Q950TSAwesome image quality HDR Standard settingNo Dolby Vision supports 8KLimited 8KO Samsung Q950TS content represents the latest 8K TV from the manufacturer, combining all the benefits of last year's Samsung Q900 8K screen with innovations first introduced to the flagship Samsung Q90 4K TV 2019 that hit the shelves earlier this year. Combined on a first-rate QLED TV, the new Samsung Q950 offers an 8K panel and image processing enhanced by AI, plus wider viewing angles, an improved black filter and standard fit HDR performance. If that wasn't enough, Samsung's smart TV platform is the most comprehensive on the market. So if you're looking for a new next-generation Samsung TV – and don't mind paying high dollar for it – the Q950TS should be at the top of your short list. Read the full review: complete: Q950TS 8K QLED (Image Credit: LG)55 inch: LG OLED55B9 | 65-inch: LG OLED65B9LG the cheapest OLEDRich colors of 2019 and sharp detailSNo the latest processingIn HDR10+The LG B9 OLED absolutely fulfills its promise – to give buyers a cheaper path in a world of OLED, with the sharp contrast and vivid colors it envelops. Inevitably there are some corners cut to get there, and you're not getting the excellent experience of the C9 or E9 – while the delayed launch of the B9 budget model, and continued price cuts for more premium sets, means that this year's B Series isn't quite the deal it would have been a few months ago. If the B9 is all your budget allows, it's a solid purchase, though scrimping and saving for the LG C9 OLED – and keeping an eye on black friday and cyber monday sales – may be a better decision in the long run. (Image credit: Samsung) New for 2020, the Samsung Q80T QLED builds on the successes of previous models for a brilliant HDR TV definitely worth checking out. The most notable feature is the incredibly low insum, making the Q80T a great choice for gamers who want responsive gameplay, but the QLED screen will also make general observation a pleasure everywhere. The Q80T is the cheapest Samsung 2020 TV to come with a full-array backlight, which means you'll get consistent brightness, though not some of the premium qualities of higher-end sets – hence why it lands lower on this list than last year's QLED Q90. It is also not as stylish as the zero frame Q950TS, with a thick body compared to other QLEDs in this year's range. However, you'll still get Samsung's latest Quantum 4K processor, vivid HDR colors and advanced smart TV features through Tizen OS. If you want more of an economy, too, the Q70R QLED is the predecessor of this TV, and will cost you a few hundred dollars less than the new Q80T model (yes, it's the line of some products, and yes, the nomenclature is confusing). Read the full review: Samsung Q80T QLED TVHow to buy TV technology is better? What is the best LCD TV? What screen size is best for your living room? What is the difference between LCD and LED TVs? The answers are not always obvious. In fact, buying a new TV can be stressful even for tech connoisseurs – as there are so many brands, so many features, so many screen sizes, colors, technologies and flavors to choose from. So what's right for you, your family and your living space? In this guide, we'll walk you through everything you need to know about buying a new TV. What kind of TV are there out there? There are many different screen types out there, all working in different ways to produce the same results. Each technology has its own unique strengths and weaknesses, so here are some fundamentals to consider:LED TV: LED direct displays are backlit by an array of LEDs (LEDs) directly behind the screen. This allows localized darkening – i.e. immediately adjacent areas of brightness and darkness to be displayed more effectively – and improves contrast. LED TVs are also more energy efficient and capable of a wider color gamut than CCFL sets. Due to the extreme cost of mounting these LED arrays, the cheapest TVs often use LED screens with illuminated edge on Direct OR Full-Array LED screens. LED TV: Edge LED With these TVs, the backlight LEDs are mounted along the edges of the panel. This arrangement allows radically thin displays and offers contrast levels higher than the CCFL, but fails to achieve the same image quality as directly lit LED sets. However, they come much cheaper and that's why most LED TVs out there now use this technology. OLED TV Backlighting in OLED (organic LED) assemblies is achieved by passing an electric current through an emissive and electroluminescent film. This technique produces much better colors and higher contrast and also allows the screens to be extremely thin and flexible. This is the display technology of the Holy Grail and LG, Sony, Philips and Panasonic have adopted it in their main sets. Quantum Dot Quantum Dot is Samsung's great game in the LED TV space. With it, the brand claims that it is able to produce more colorful images than LG and Sony, offering even brighter panels. LG's Super UHD TVs use a variation of Quantum Dot called Nano Cell, and Hisense makes a number of Quantum Dot TVs for the U.S. and China.TV curve some manufacturers are still making TVs that have slightly curved screens. But unlike the old CRT TVs, the curve is inward and not outward. The idea is that this will make each pixel equidistant from your eyes, delivering a more satisfying image. However, there are disadvantages to this type of screen, the main one being that if you sit long enough to one side – more than 40 degrees or more – the curve clearly begins to affect the geometry of the image, abbreviating the content near you and compressing the center of the image. What resolution technology should I go to? HD HD TVs come in two resolutions. Sets with HD ready are required to be able to display a minimum image of 720p, and usually have a screen resolution of 1366 x 768 pixels. Meanwhile, Full HD TVs have a higher resolution of 1920 x 1080 pixels. It is highly advisable that you do not go for anything less than full HD these days. Ultra HD and 4K Ultra HD resolution is exactly four times higher than full HD – 3840 x 2160. It means a much more detailed image, with content that requires much more bandwidth and storage space. 4K TVs tend to be good at upscaling hd video to Ultra HD, but currently there are very few options for watching native 4K content. Read more about 4K 8K resolution If the 4K is not enough to impress you, there are now a good number of 8K TVs coming into the market. This ultra-ultra-ultra-high definition format packs in four the number of pixels as 4K, for even sharper and sharper images. The difficulty is that there is little 8K content available – nothing on Netflix, for example! This means that these sets need highly advanced processing to make upscale upscale or 4K content for 8K screens, and while it's not yet a must-see technology, it's certainly where the TV market is going. Read more about 8K HDR resolution No doubt switching to HDR video can make a more dramatic difference to your viewing experience than moving from HD to 4K. Like HDR images, the mobile version expands the range of the light and dark ends of the spectrum, providing more detail for both. HDR needs new shooting methods – there's currently no way to back up HDR to existing video. It also needs new TV technology, with Samsung being the only one creating specific screens, although LG and Sony can upgrade some of their existing actions to be compatible. Buying a flat-screen television is a great investment and one you can't afford to take lightly. Just entering the nearest store and picking up the first plasma or LCD you see won't give you the best deal, the screen that suits your needs, or the equipment you need to make the most of your new purchase. Size issues People tend to choose the size of their flat TV based on the amount of space they have for it, this is not necessarily wise. Flat TVs take up much less space than you might think, so your new TV may end up one or two feet further from your viewing position, making the image appear smaller. Also, with hi-def, you can have a larger screen and the same viewing distance without worrying about choose spots inherent to the source. The lack of noise from a 4K TV means that the ideal distance to sit from the screen is three to four times the height of the TV. What TV size should I buy? How many HDMI sockets do I need? For a living room TV, you should be looking for a minimum of 3 HDMI inputs. If you want to attach a set-top box as well as gaming consoles etc. (Image credit: iStock) Want to hang my TV on the wall? First, you'll need to consult a construction specialist to see if the wall in question is strong enough to support a flat screen. Then find out if the set you want is designed to be wall mounted and, if so, ask if the relevant bracket is included in the basic package or as an optional add-on. Am I going to connect you to a home theater? If the answer is no, you may want to think more carefully about the audio performance of your set. Look for a screen that can go as high as you need without distortion or cabinet rattle. Consider how the dialogue is and how much the bass is capable of low-end rumble. On the other hand, it is useless to pay more money for exceptional built-in speakers if you already have a decent home cinema system. Other buying guides to check
